Contact: Dr Ngoun Chanpheaktra at pheaktra@angkorhospital.org for more information on cDMAT and CB-DMAT

Overcoming Obstacles and Moving Towards a Multidisciplinary Approach to Rehabilitation!!

Childhood development milestones are essential skills that define the way a child can participate socially, physically, and intellectually. Not reaching these milestones on time can be an indicator of a developmental delay, and the child must be assessed in time for early support.

To assess these skills and detect delays/disabilities, a culturally sensitive and environmentally appropriate tool specific to Cambodian children has been created based on an observational study in Cambodia children. The tool is called the Cambodian Developmental Milestone Assessment tool (cDMAT).

The cDMAT consists of reference graphs for four functional domains (socio/personal, fine motor, language/cognition and gross motor skills), providing age norms of achievement of 129 milestones for children up to six years old.

The cDMAT should be applied by trained health professionals or preschool teachers. It requires practice to remember the specific assessment steps and performance definitions for each milestone.

CB-DMAT

The cDMAT can be too time consuming for nurses and too complex for use at the community level with the parents. Therefore, a shorter, simpler and community-based DMAT (CB-DMAT) has been developed.

The CB-DMAT can be used at health centres and community level to potentially trigger the referral of children with suspected developmental delays to a trained paediatrician or physiotherapist.

Outlook

Before a country-wide implementation of the cDMAT and the CB-DMAT can be envisaged, it would be a step in the right direction to create a small-scale comprehensive pilot service provision network within the public and the private sector. This endeavor should cover child developmental milestones monitoring, assessment and intervention as provided already at the Angkor Hospital for Children (AHC).
